

So we know how it went, from “getting a vaccine means Covid stops with you”, down to “it protects you from getting sick”, down to “it mostly protects you from getting hospitalized”.

Well, the new data from the UK says: **the “vax” does not reduce your chances of hospitalization at all.**

The epidemiological relevance of the COVID-19-vaccinated population is increasing

[The epidemiological relevance of the COVID-19-vaccinated population is increasing](#)

[Previous Article The impact of COVID-19 in nursing homes in Madrid, ...](#)

[Next Article Underestimating the lung cancer mortality reductions produced ...](#)

High COVID-19 vaccination rates were expected to reduce transmission of SARS-CoV-2 in populations by reducing the number of possible sources for transmission and thereby to reduce the burden of COVID-19 disease. Recent data, however, indicate that the epidemiological relevance of COVID-19 vaccinated individuals is increasing. **In the UK it was described that secondary attack rates among household contacts exposed to fully vaccinated index cases was**

similar to household contacts exposed to unvaccinated index cases (25% for vaccinated vs 23% for unvaccinated). 12 of 31 infections in fully vaccinated household contacts (39%) arose from fully vaccinated epidemiologically linked index cases. Peak viral load did not differ by vaccination status or variant type [1]

]. In Germany, the rate of symptomatic **COVID-19 cases among the fully vaccinated (“breakthrough infections”)** is reported weekly since **21. July 2021** and was **16.9%** at that time among patients of 60 years and older [2]

]. This proportion is increasing week by week and was **58.9%** on **27. October 2021 (Figure 1)** providing clear evidence of the increasing relevance of the **fully vaccinated as a possible source of transmission**. A similar situation was described for the UK. Between week 39 and 42, a total of **100.160** COVID-19 cases were reported among citizens of 60 years or older. **89.821** occurred among the fully vaccinated (**89.7%**), **3.395** among the unvaccinated (**3.4%**) [3]

]. One week before, the COVID-19 case rate per 100.000 was higher among the subgroup of the vaccinated compared to the subgroup of the unvaccinated in all age groups of 30 years or more. In Israel a nosocomial outbreak was reported involving 16 healthcare workers, 23 exposed patients and two family members. The source was a fully vaccinated COVID-19 patient. **The vaccination rate was 96.2% among all exposed individuals (151 healthcare workers and 97 patients).** **Fourteen fully vaccinated patients became**

severely ill or died, the two unvaccinated patients developed mild disease [

[4]

]. The US Centres for Disease Control and Prevention (CDC) identifies four of the top five counties with the highest percentage of fully vaccinated population (99.9–84.3%) as “high” transmission counties [

[5]

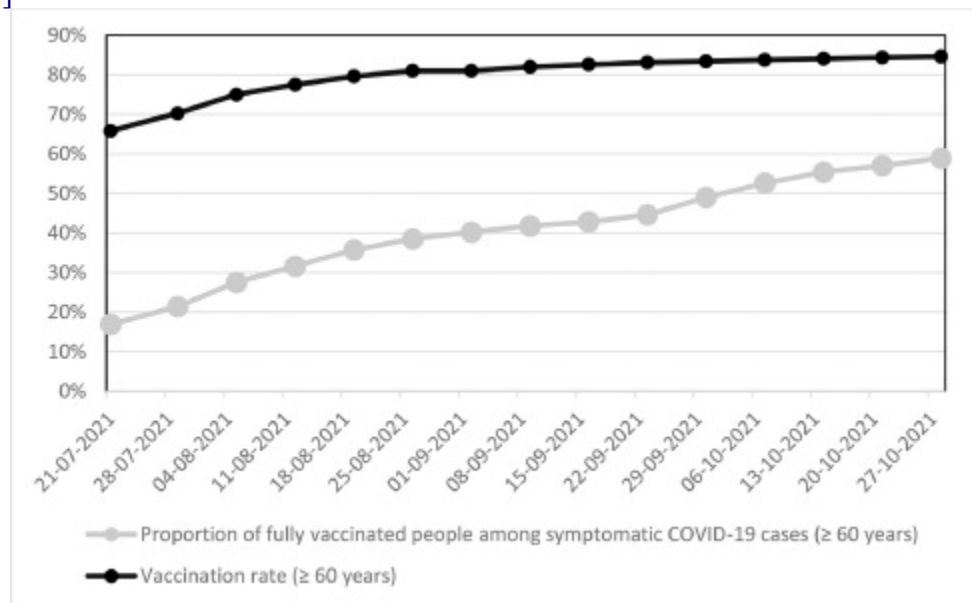

]. Many decision makers assume that the vaccinated can be excluded as a source of transmission. It appears to be grossly negligent to ignore the vaccinated population as a possible and relevant source of transmission when deciding about public health control measures.

Figure 1 Vaccination rates and proportions of fully vaccinated people among symptomatic COVID-19 cases (≥ 60 years) in Germany between 21. July and 27. October 2021 based on the weekly reports from the Robert Koch-Institute

UK: Being Vaccinated **DOUBLES** the Risk of Getting Omicron

Boosting is worse than no-vax

Igor Chudov
Dec 21, 2021

107

An interesting [post](#) on substack today mentioned a brand new and interesting data set: the [UK Coronavirus Infection Survey](#) from Dec 21. My quick post will take a slightly different take on the data, that is nothing short of shocking but completely agrees with what is happening in Denmark.

Screening characteristic		Category	Estimated likelihood of testing positive for COVID-19 with an Omicron probable result (odds ratio)	Lower 95% confidence interval	Upper 95% confidence interval	p-value	Number of Omicron probable positives	Total sample
Vaccination status	Not vaccinated (Reference)		1	-	-	-	14	536
Vaccination status	1 dose		1.57	0.52	4.54	0.413	8	144
Vaccination status	2 doses, more than 14 days ago		2.26	0.78	7.45	0.157	72	944
Vaccination status	3 doses, more than 14 days ago		4.45	1.29	17.03	0.023	21	185
Previous COVID-19 infection	No (Reference)		1	-	-	-	105	1,760
Previous COVID-19 infection	Yes		3.22	1.31	7.29	0.007	10	56
Work Status	Employed, working (Reference)		1	-	-	-	79	926
Work Status	Employed, not working		0.67	0.03	4.20	0.725	*	19
Work Status	Not working		0.70	0.19	1.97	0.537	4	65
Work Status	Retired		0.94	0.28	3.02	0.919	11	190
Work Status	Child/student		1.62	0.41	6.39	0.486	20	616
Travel abroad status (In the last 28 days)	No (Reference)		1	-	-	-	92	1,735
Travel abroad status (In the last 28 days)	Yes		4.60	2.41	8.62	0.000	23	81

Source: Office for National Statistics - Coronavirus (COVID-19) Infection Survey

The conclusion from this data is that in the UK, **being vaccinated DOUBLES the chance of catching Omicron compared to the unvaxxed.**

How could this be? Isn't it crazy?

It can easily happen, exactly the same thing is happening in Denmark, and the article below will hopefully explain.

Using UK population and the number of vaccinated Brits, let's arrange the data into easier form:

The most damning piece is that the ignorant, science-denying unvaccinated, in the UK, are 25% of the population, but they ONLY get 12.2% of Omicron cases. **This means that the unvaxxed are TWICE LESS LIKELY to get Omicron and, therefore, the vaccinated are TWICE MORE LIKELY to get Omicron. Somehow, their vaccination status makes the vaccinated twice more susceptible to catching Omicron compared to the “comparison group”.**

Wow. How can this be? Please read my previous Denmark update —

it has a section dedicated to this question — and the discussion for that post for details. All of the explanations portend future bad news to the vaccinated.

Here's what I said about Denmark, which 100% applies to the UK:

What is going on? I can think of three explanations.

- **The unvaccinated include more Covid-recovered who are immune to Covid. This is very uncertain as to the extent of this, as many recovered persons were bamboozled into getting a vaccine also.**
- **The vaccine antibodies are actually aiding and abetting Omicron in penetrating mucosal barrier and overcoming immune defenses. This is called “ADE” and was much discussed on substack, in my previous post as well as many others. Click on the links in the above article.**
- **The vaccine generally destroys immunity, and Omicron evades vaccine antibodies, making Omicron as infectious as without the vaccine, but without the working immune system to oppose it.**

Wait, but boosters will save us!

No, they will not. The UK data that I am describing, is dated up to

December 12. This means that the number of “fully boosted”, that is, boosted persons who had more than 14 days past booster, is the number of individuals receiving booster shot as of Nov 27 (more than 14 days before Dec 12), or 17,611,000 persons.

The number of Omicron cases among these fully boosted by Dec 12, is 1.23 per million (**21 cases per 17.611 million boosted**).

The number of Omicron cases among unvaccinated persons is 0.82 per million (**14 cases per 17.126 million unvaccinated**).

So the boosted are also in a worse position, compared to the unvaccinated, with higher rate of illness.

Such is the “success” of vaccination policy in the UK. Mind you, I am not badmouthing the UK. I am in the US and we are facing exactly the same failure, but do not have reporting agencies like the UK does, to tell us the truth.

The vaccinated are now entrapped in a “**vaccine trap**”, whereby boosters give a short and small improvement, **but still leave them worse off than the pure-blood unvaccinated persons.**

Will boosters prevent “severe cases”?

It is way to early to tell. There is, at present, zero evidence that boosters, or vaccinations against the two year old Chinese Wuhan virus that is long extinct, reduce severe outcomes from Omicron

with its extensive immune evasion. **The so-called “experts” who “expect protection from boosters”, are pulling their opinions from thin air.**

33 out of 34 hospitalized Omicron Patients in Delhi are FULLY VAXXED

India is only 40% fully vaxxed

<https://igorhudson.substack.com/p/33-out-of-34-hospitalized-omicron>

<https://indianexpress.com/article/cities/delhi/out-of-34-omicron-cases-at-delhi-hospital-33-are-fully-vaccinated-7686188/>

The mRNA magic soup does restores “protection”, but in a very odd manner:

- the first two weeks past the booster shot give the vaccine strongly NEGATIVE or at least NO protection (depending on primary series). This is why people who received a booster shot, are not considered “fully boosted” until two weeks pass after the jab. The infections occurring in these first two weeks are not officially counted “against” the booster, overstating effectiveness of this treatment. This is discussed in my article “[Boris Johnson's Biggest Blunder](#)”.

▪_

- Then at two weeks, [according to the UK](#), booster becomes great again, and vaccinees enjoy “protection”, however only amounting to measly 55%. However, booster protection starts declining right away. By just extrapolating the line, booster protection may evaporate after about 17 weeks. (nobody knows exactly when, but you get the idea)

● ▪_

- **So the boosted have two terrible first weeks, then a few decent weeks, quickly turning into so-so protection, and going to no protection again in 17 weeks, give or take.**

If this is not “vaccine failure”, then what is?

<https://igorhudov.substack.com/p/denmark-vaccine-a-danger-to-the-vaxxed>

An amazing Lancet letter “The epidemiological relevance of the COVID-19-vaccinated population is increasing” was just published.

The largest significance is that the article WAS ALLOWED TO BE PUBLISHED BY LANCET.

This means that the tide of scientists being scared by government/globalists/Big Pharma funding is turning, and the truth is coming out at the highest levels of science such as the Lancet.

The article is great, but the things it is saying are a regular subject of our discussion.

□

- In the UK it was described that secondary attack rates among household contacts exposed to fully vaccinated index cases was similar to household contacts exposed to unvaccinated index cases (**25% for vaccinated vs 23% for unvaccinated**).
- **12 of 31 infections in fully vaccinated household contacts (39%) arose from fully vaccinated epidemiologically linked index cases.**
- Peak viral load did not differ by vaccination status or variant type
- In Germany, the rate of symptomatic COVID-19 cases among the fully vaccinated (“breakthrough infections”) is reported weekly

since 21. **July 2021 and was 16.9%** at that time among patients of 60 years and older [[2]]. This proportion is increasing week by week **and was 58.9% on 27.**

- In Israel a nosocomial outbreak was reported involving 16 healthcare workers, 23 exposed patients and two family members. The source was a fully vaccinated COVID-19 patient. **The vaccination rate was 96.2% among all exposed individuals (151 healthcare workers and 97 patients). Fourteen fully vaccinated patients became severely ill or died, the **two unvaccinated patients developed mild disease****
- US Centres for Disease Control and Prevention (**CDC**) **identifies four of the top five counties with the highest percentage of fully vaccinated population (99.9–84.3%) as “high” transmission counties.**
- A similar situation was described for the UK. Between week 39 and 42, a total of 100.160 COVID-19

cases were reported among citizens of 60 years or older. **89.821** occurred among the fully vaccinated (89.7%), **3.395** among the unvaccinated (3.4%) [[3]].

This reinforces my opinion that the Covid Cult is coming apart at the seams and the failure of “Covid vaccines” is no longer a secret.
